

**ADVANCED**  
ROBOTICS

**ADVANCED**  
ROBOTICS

# Who we are

---

- Danilo Verzeletti, president of Evolut Spa until 2016 and CEO of Evolut China until 2020.
- September 2021 Advanced Robotics, founded in partnership with Edoardo and Francesco Buffoli in September 2020
- 30 years of experience in new robotic systems and service thanks to our technicians
- Synergy with several partners of the Blue Tech Hub

# BUFFOLI INDUSTRIES

# Typology of robotics cells:

---

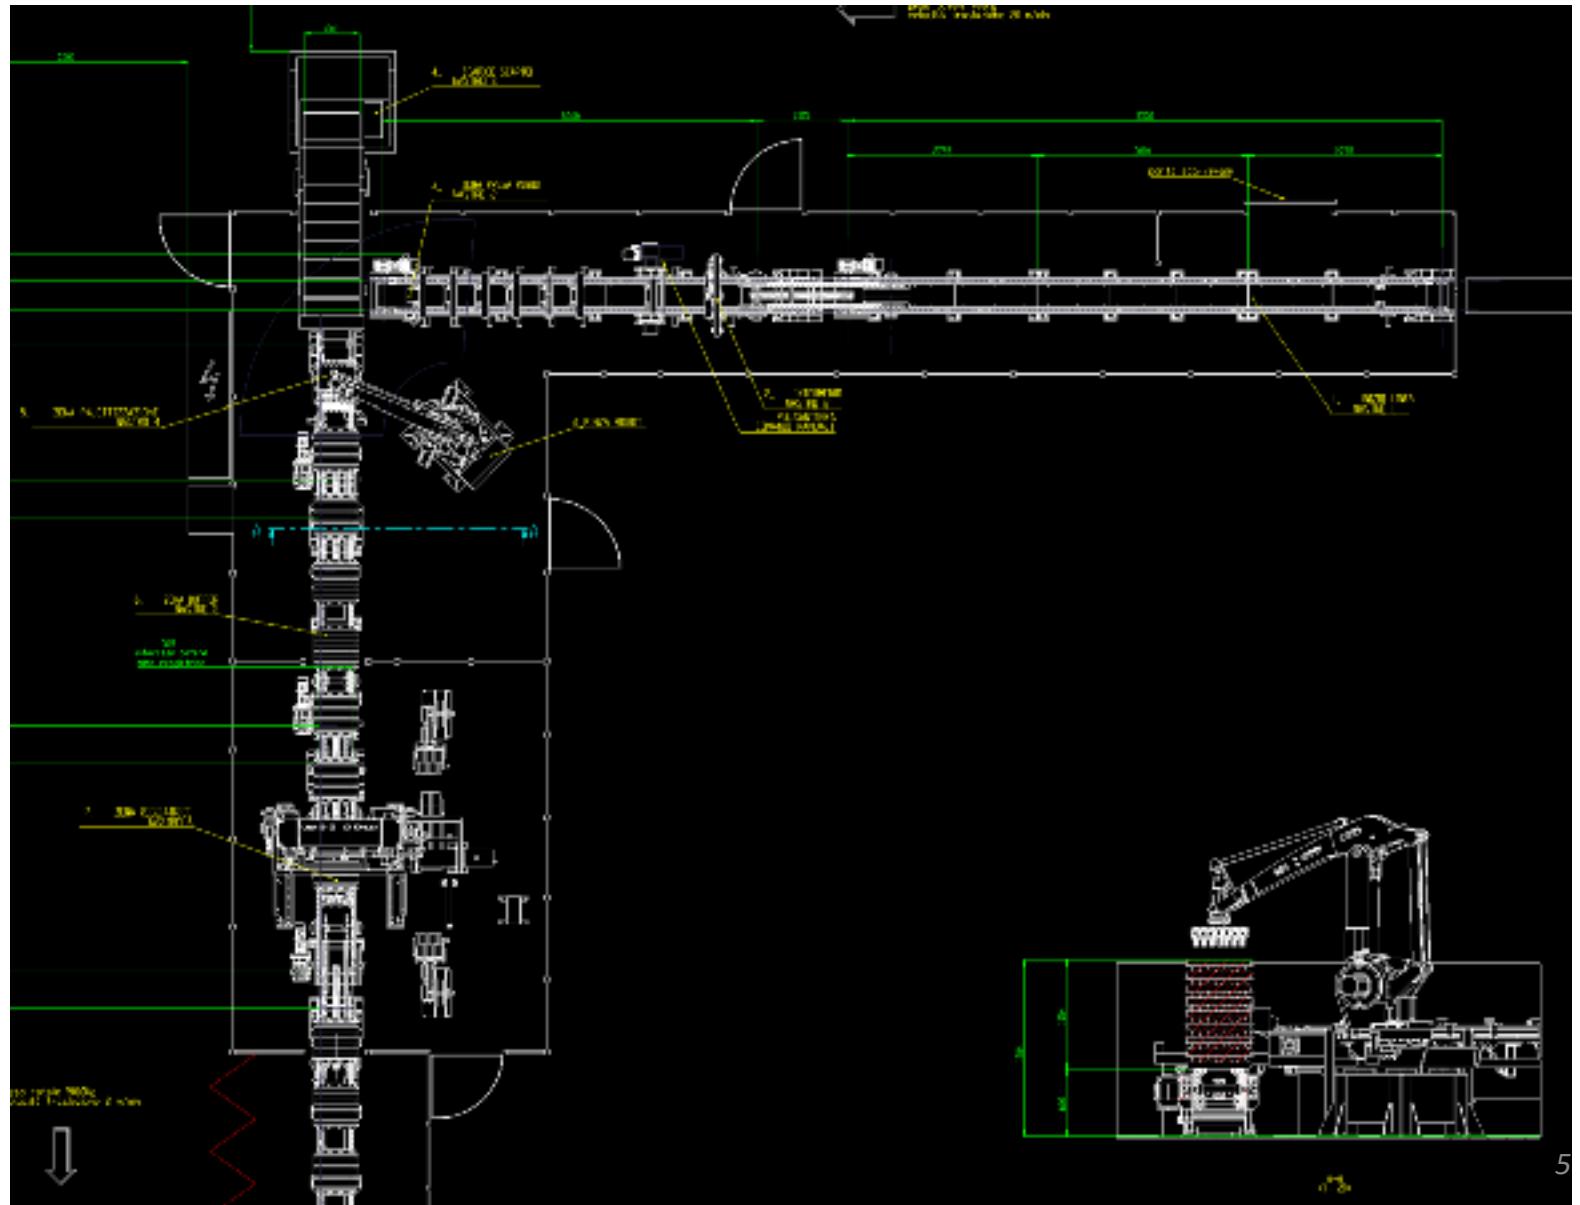

- Foundry
- Handling
- Assembly
- Palletization
- Cutting and deburring
- Robotic applications on machine tools and transfers
- Spot welding
- Quality check
- Special installation

# Palletizing of aluminum ingots

Palletizing ingots from  
continuous casting

Ingots orientation control  
system

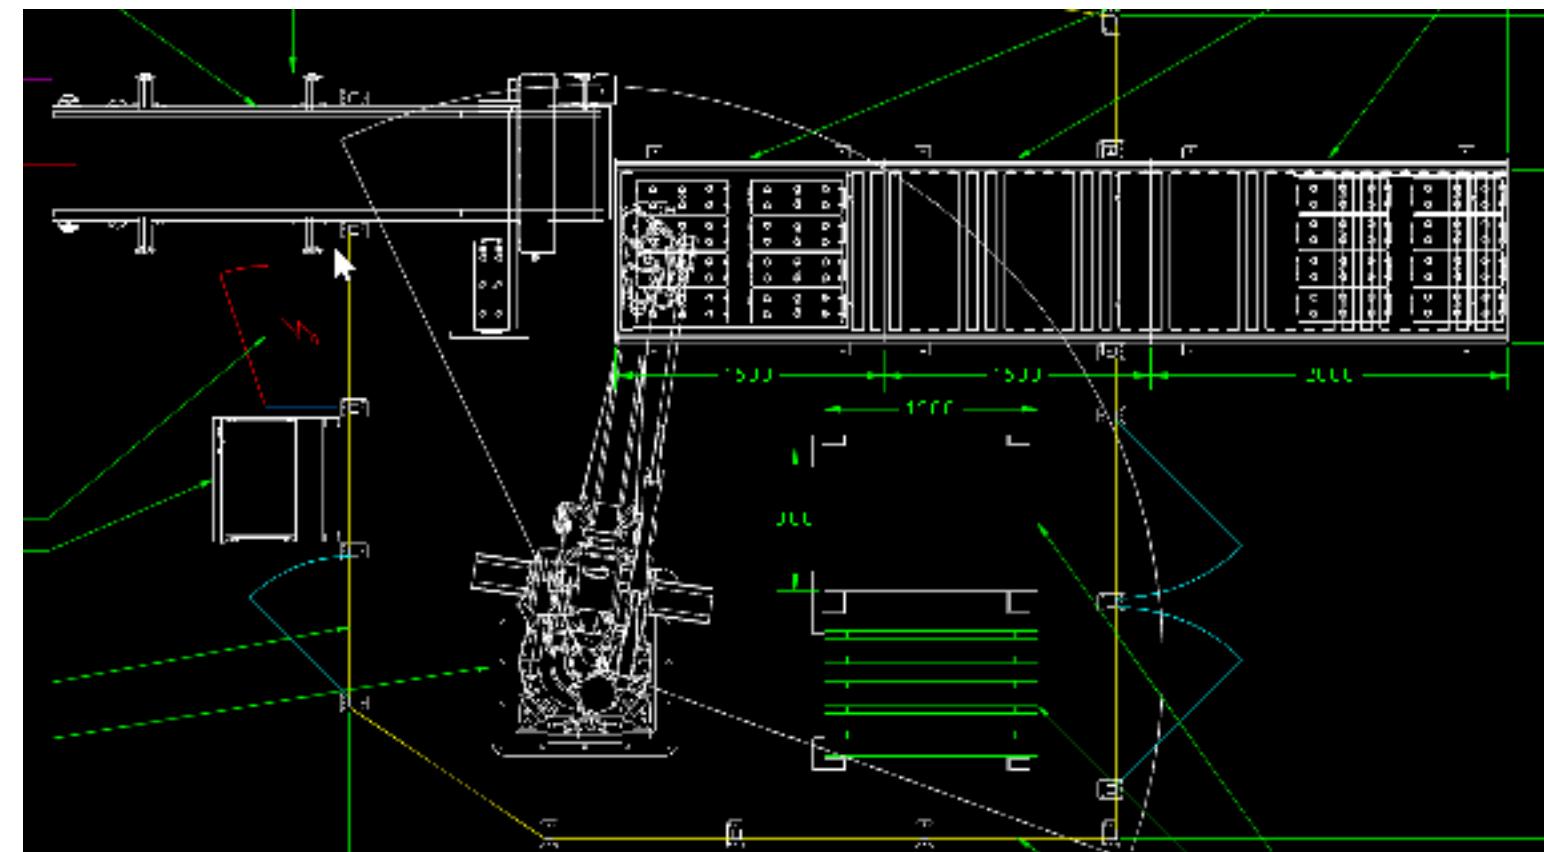

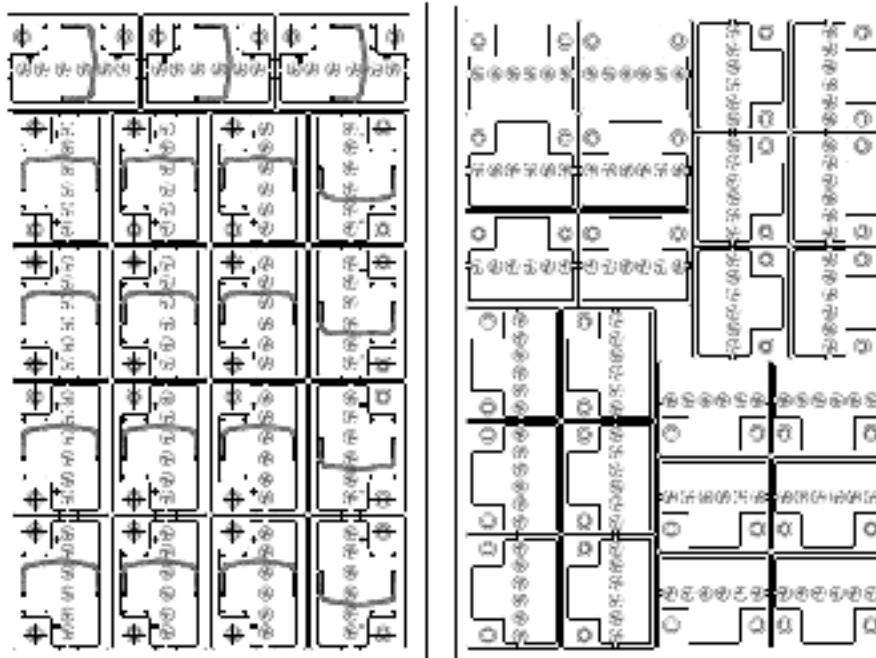

# Palletizing of aluminum ingots

# Palletizing batteries

- Multiple pallet configurations
- Palletizing software
- Management of different types of batteries
- Interlayer management

Management of multiple codes

48 pieces for an autonomy of  
4 hours

No experienced operators  
required

Pallet with laser cut sheets.

# Transfer

Transfer loading and unloading

Grip with vision systems  
for transfer loading

Marking of the finished  
piece

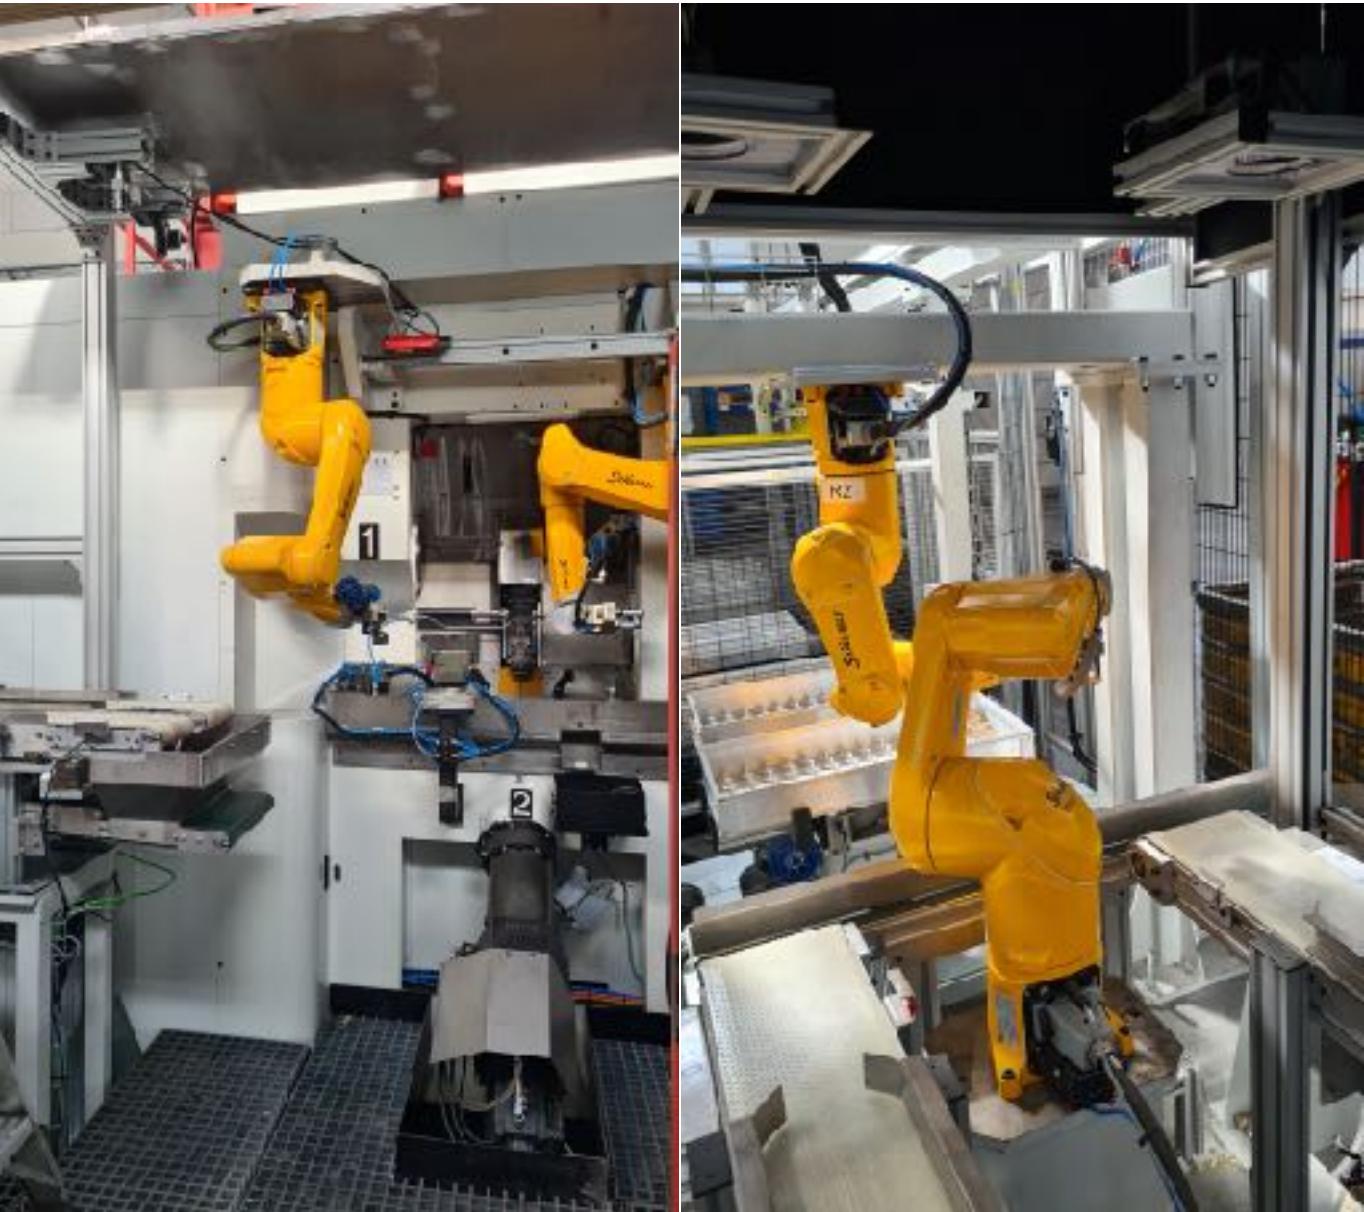

# Transfer

Cycle time: 2 seconds

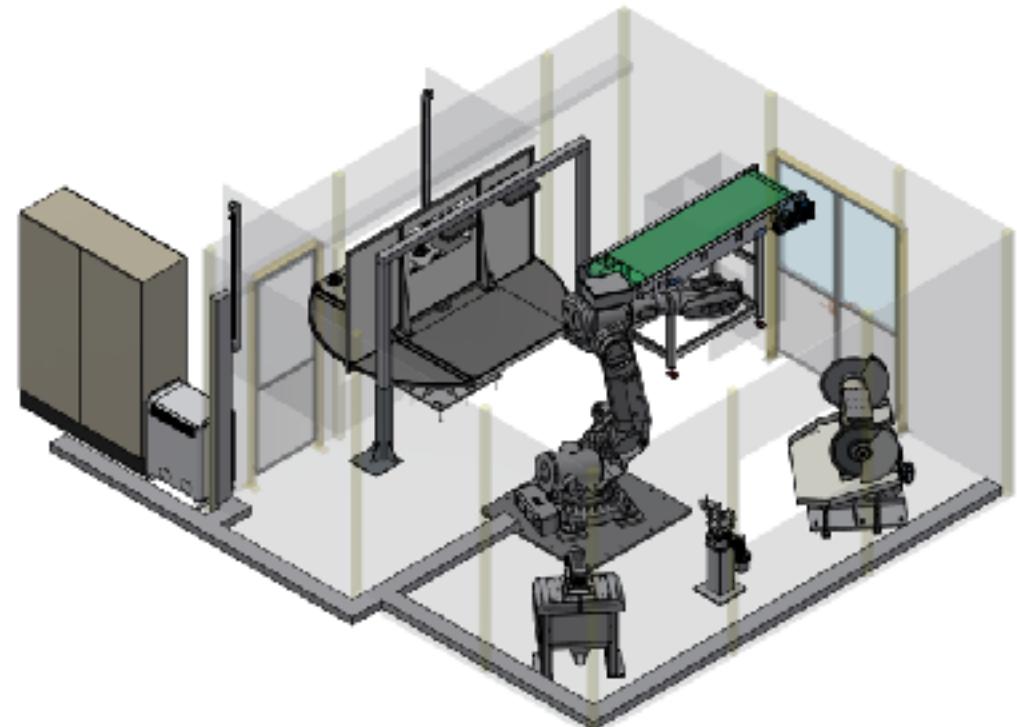

Input: Foundry crude

Output: Pallets ready for assembly

# Cast iron deburring

- Rotary table and Foresight vision system for workpiece pick-up.
- Diamond grinding wheel and tip for the deburring phase
- Compensated tools and robot feedback to avoid collisions

# Special Installations: Franciacorta Bottles

Handling from the refining baskets  
to the remuage baskets.

24 bottles per grip

7 bar of pressure in a bottle

Precision handling without stirring  
the deposited yeasts.

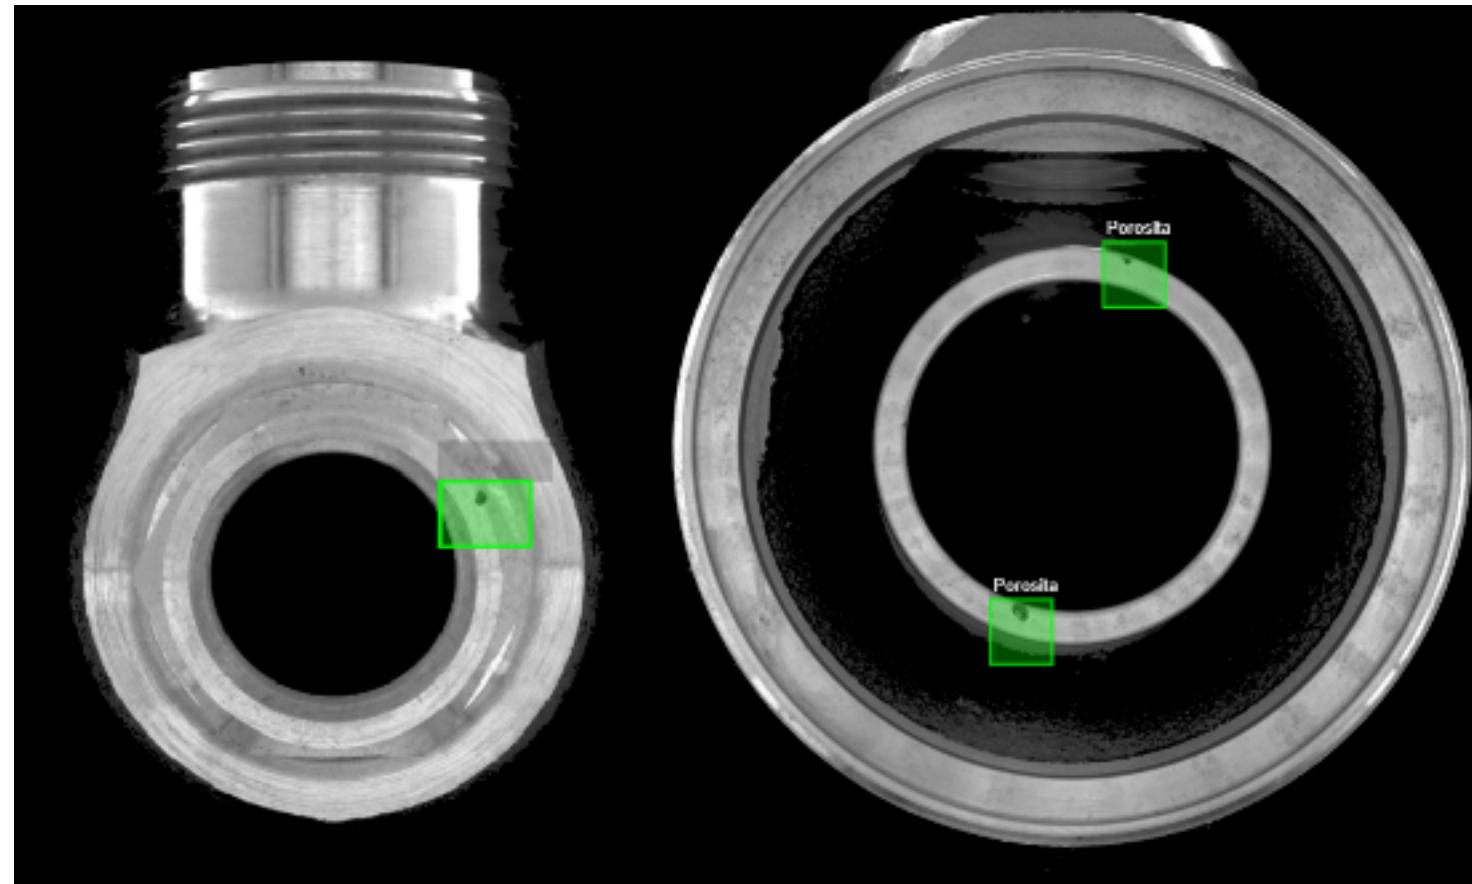

Soft touch process to recognize the  
status of both the loading basket  
and the unloading basket

Quality check of both raw components and processed products.

Types of details controlled:

- Porosity
- Cracks
- Lack of materials
- Dents
- Burrs
- Scratches
- Vibration due to machining

*Robotic cell for quality control with Artificial Intelligence:*

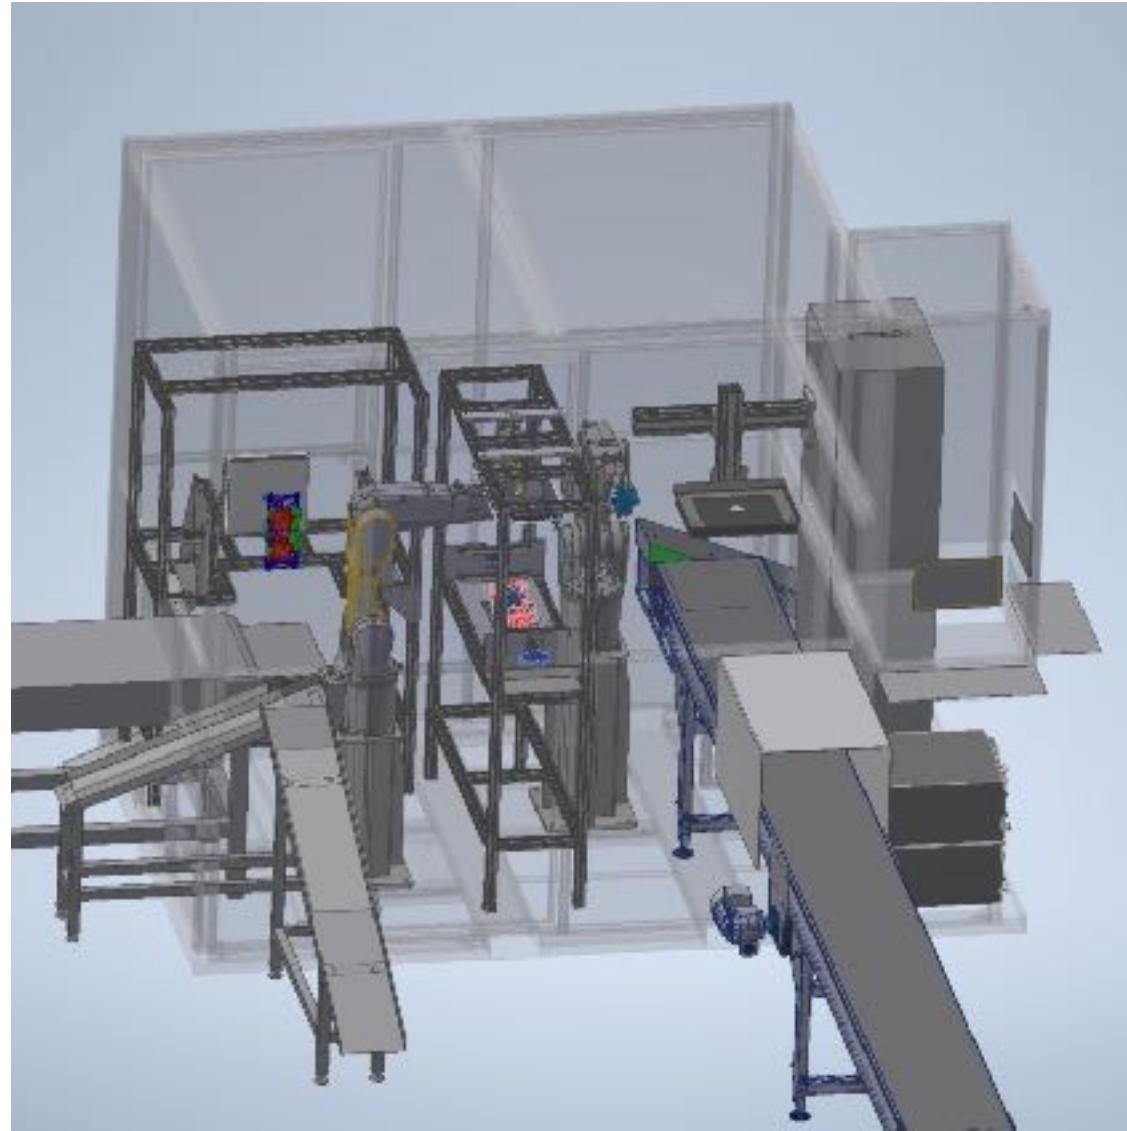

- Objective - Fast
- Repeatable - Accurate
- Track - Safe

**Cloud platform or Local server** for AI training

- AI training with few samples ( about 50)
- Validation of models before putting them into production

Runtime

- Performance from industrial production

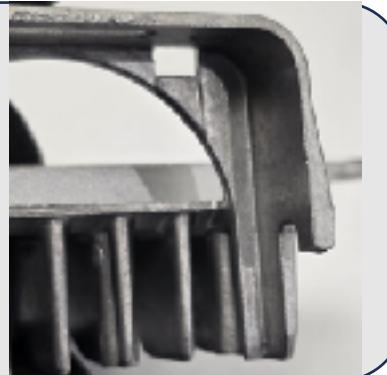

# Defects:

*Aluminium  
Flakes*

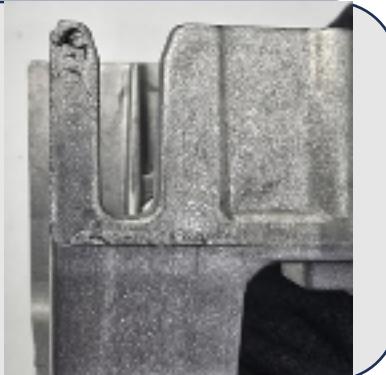

*Missing  
Material*

*Burrs*

*Porosities*

*Bubbles*

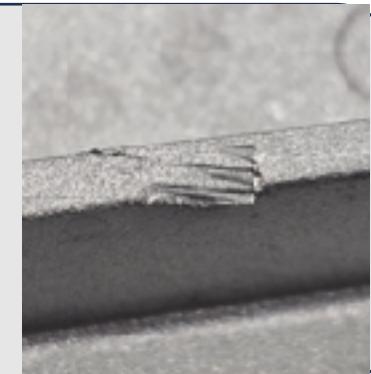

*Spots*

*Broken  
Pins*

*Dents*

# Examples of analysis

The anomaly detection model outputs a **heatmap** of the inspected part.

If the heatmap appears entirely **blue**, the part is within standard quality parameters.

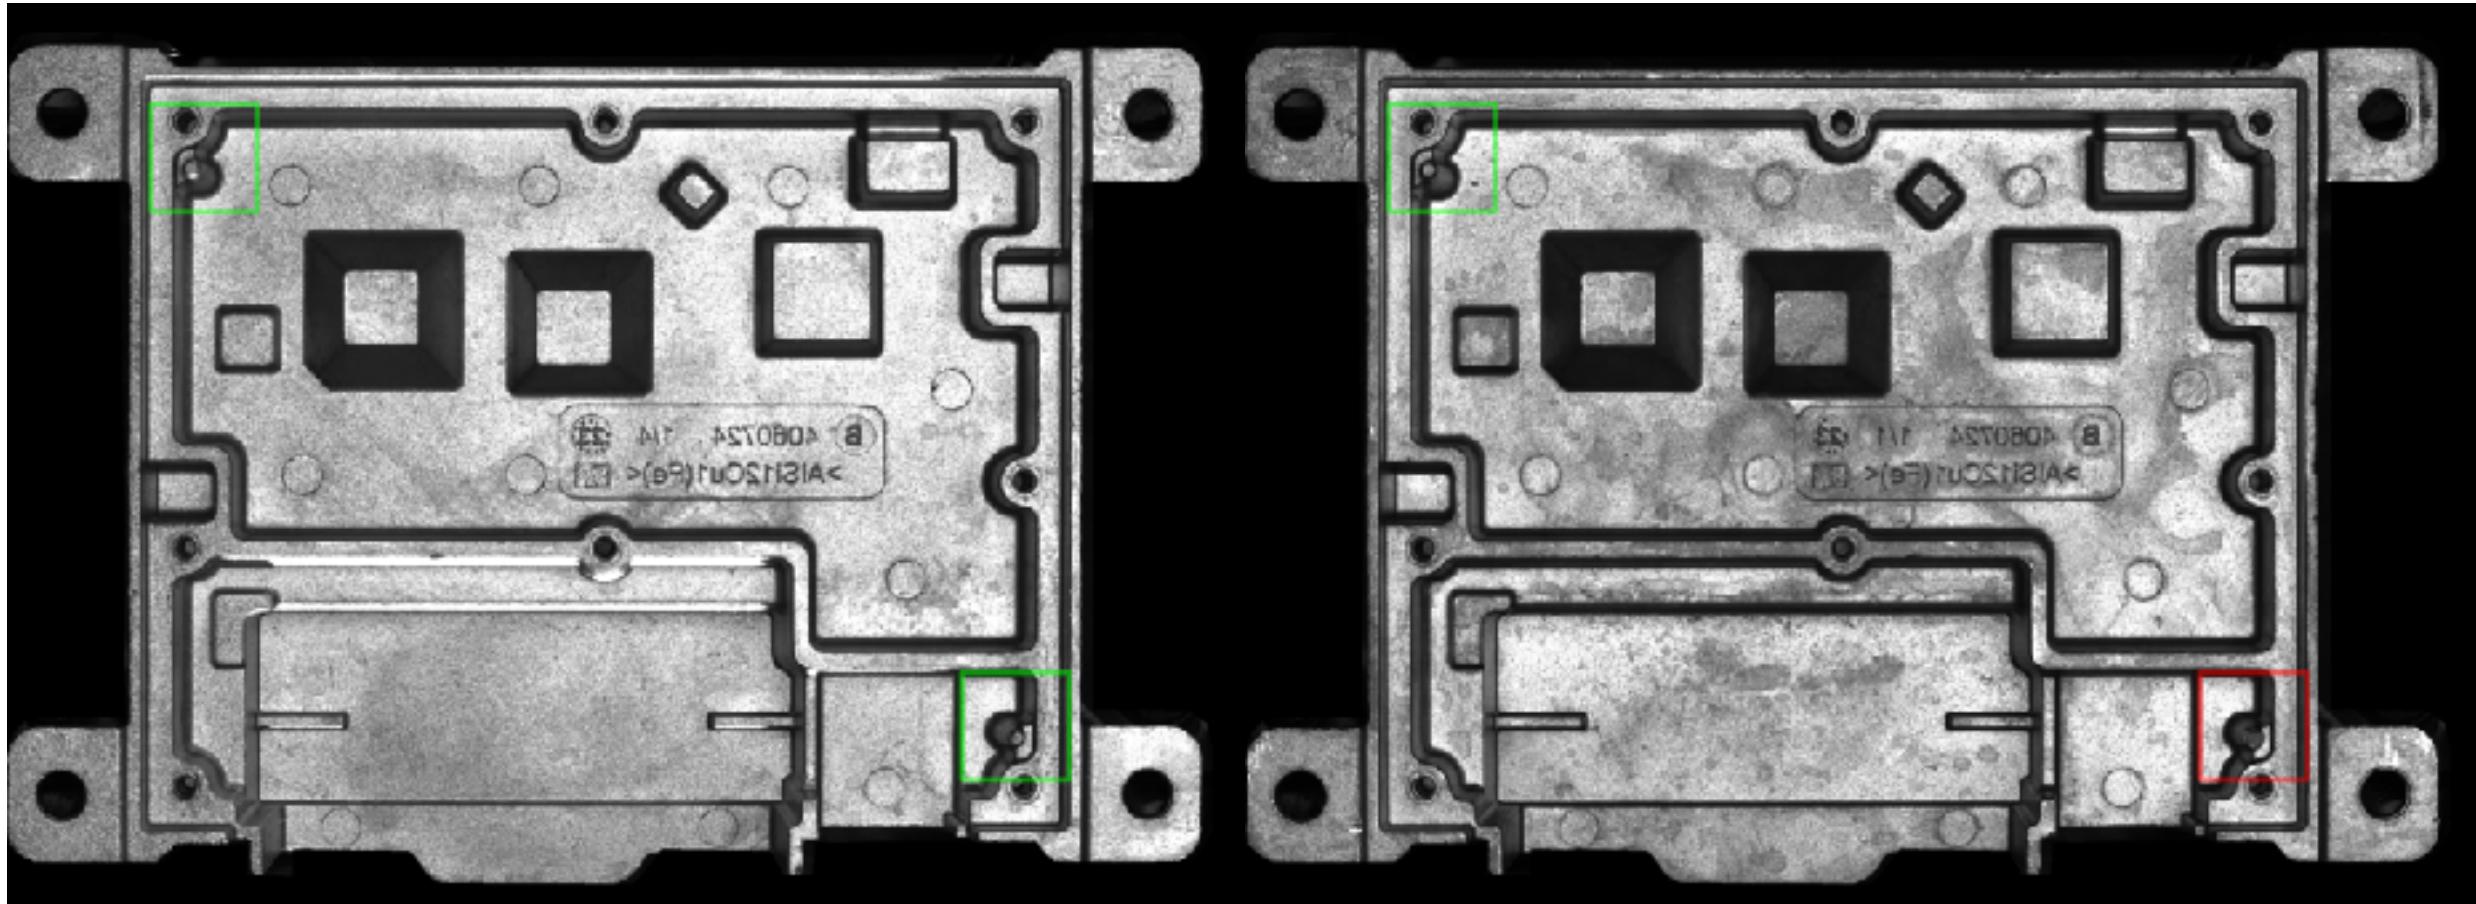

**Red-highlighted areas** indicate detected anomalies.

This model is particularly effective in identifying **material shortages** and **macroscopic defects**.

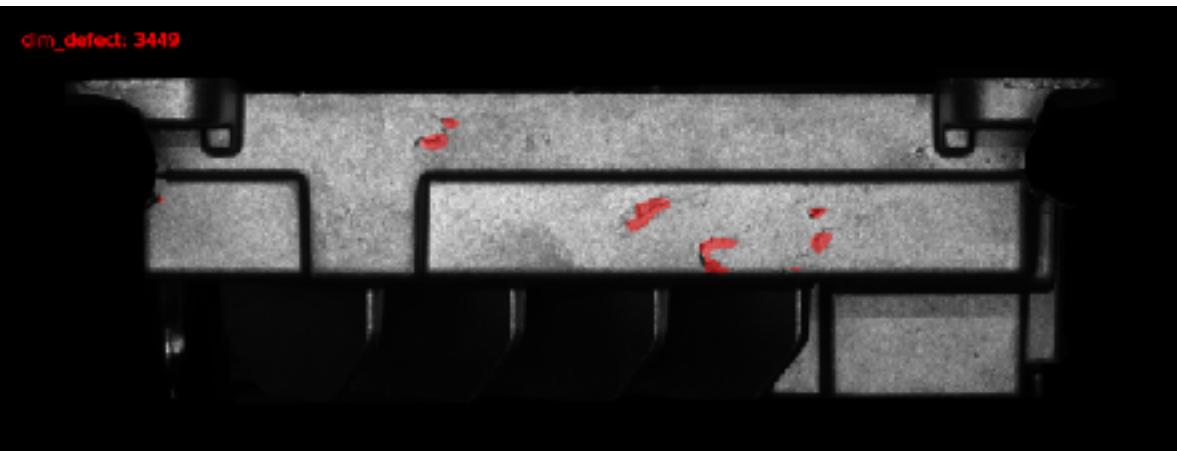

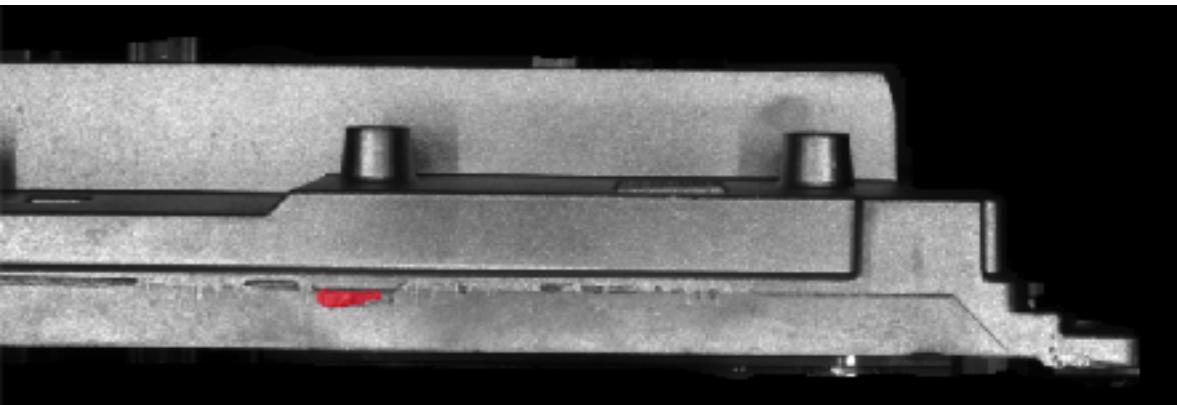

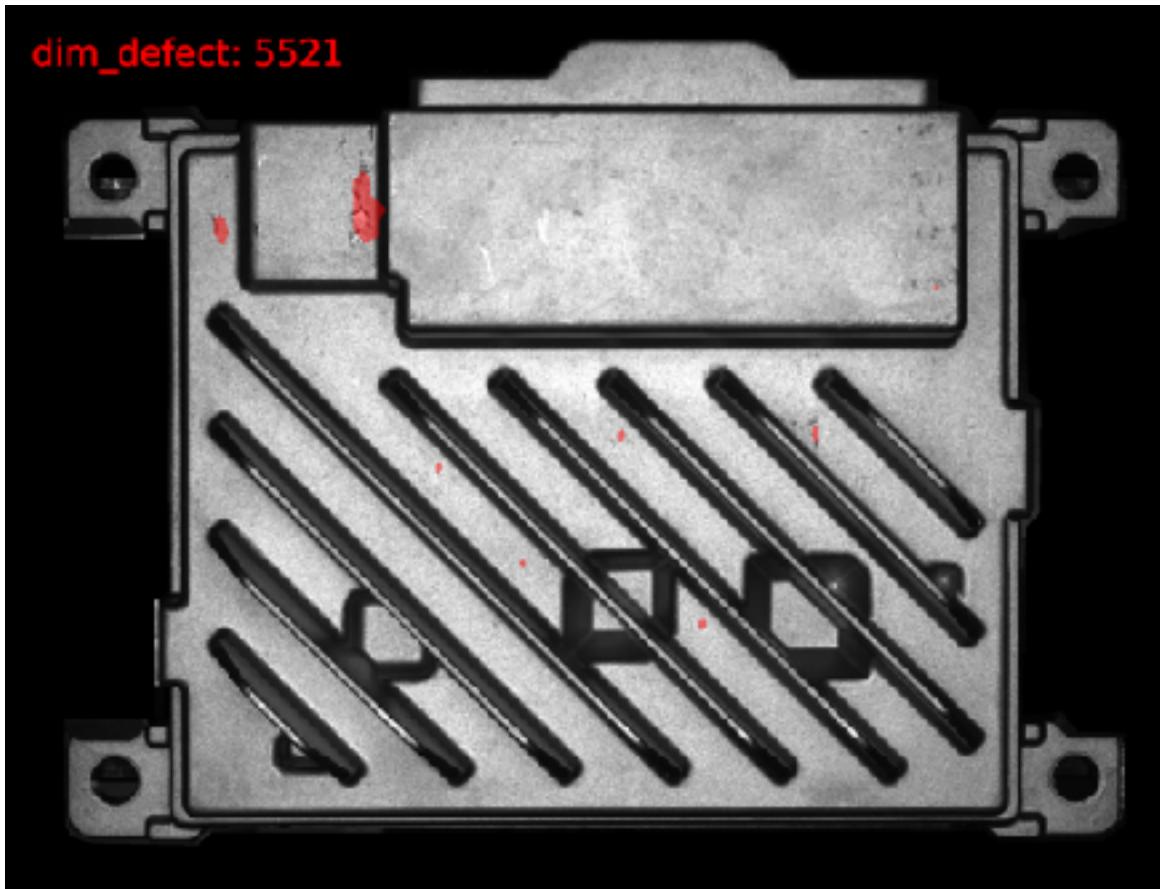

# Pin inspections

- Check for **pin presence** and **integrity**.
- **Green boxes** indicate intact pins, while red boxes highlight damaged ones.

Identification of specific defects as burrs and foils

The segmation highlights pixel per pixel the defects.

# Use Cases: Internal inspection of raw foundry pieces

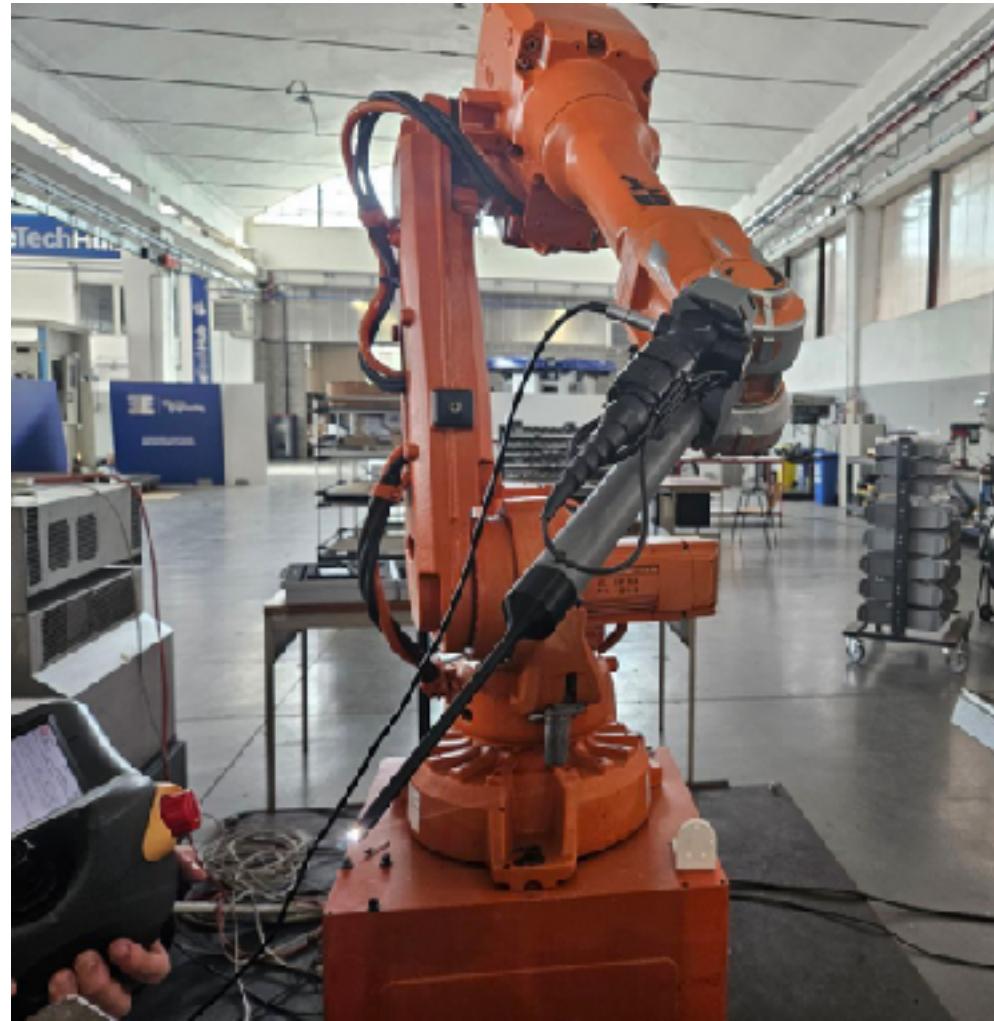

Internal inspection of raw foundry pieces.

Two type of boroscopes:

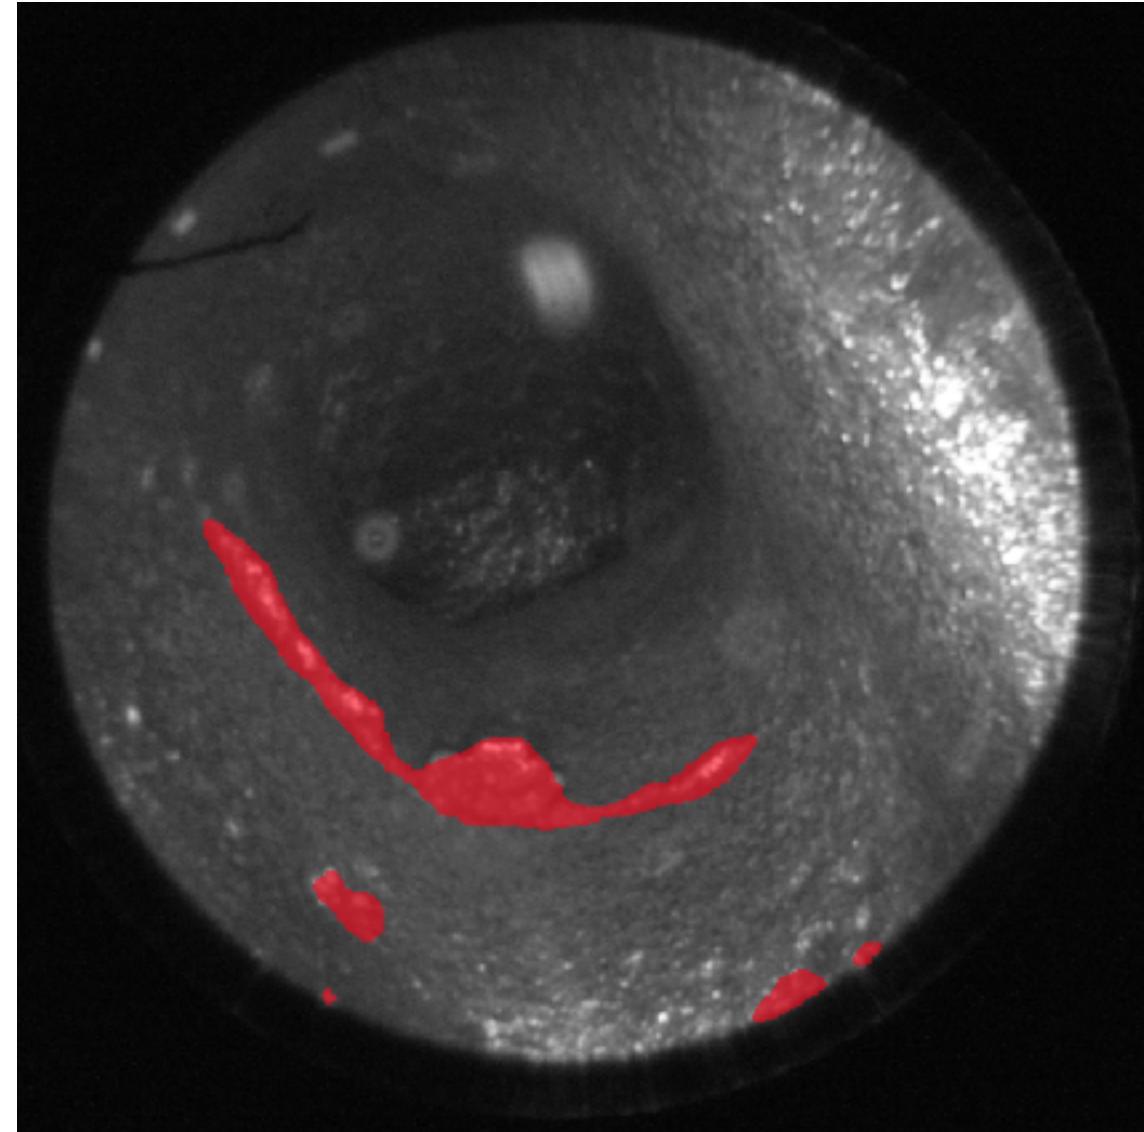

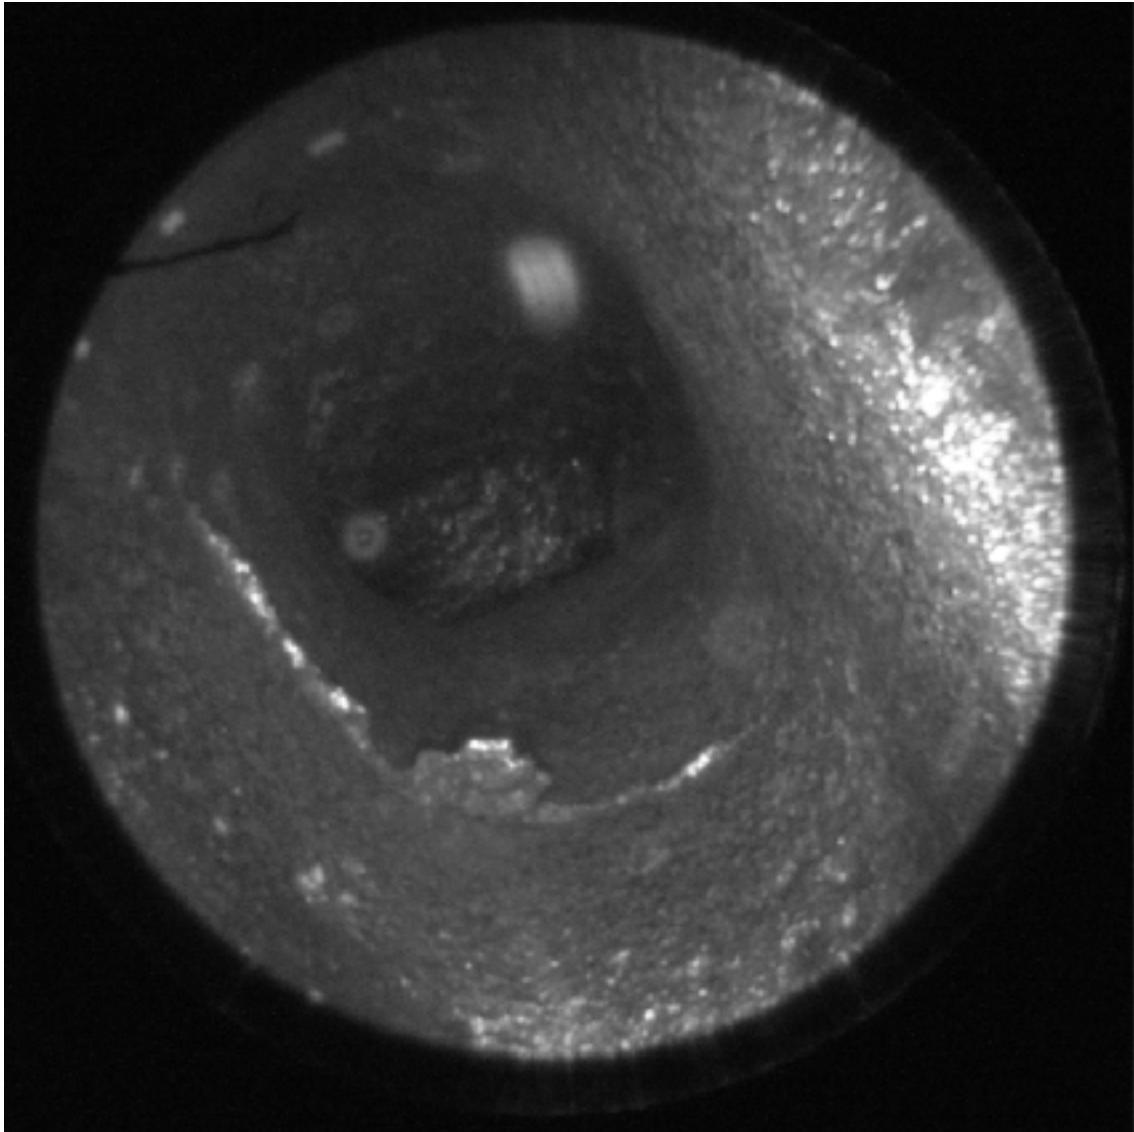

- 0° degrees
- 90° degrees

Defects:

- Ridge inside the holes

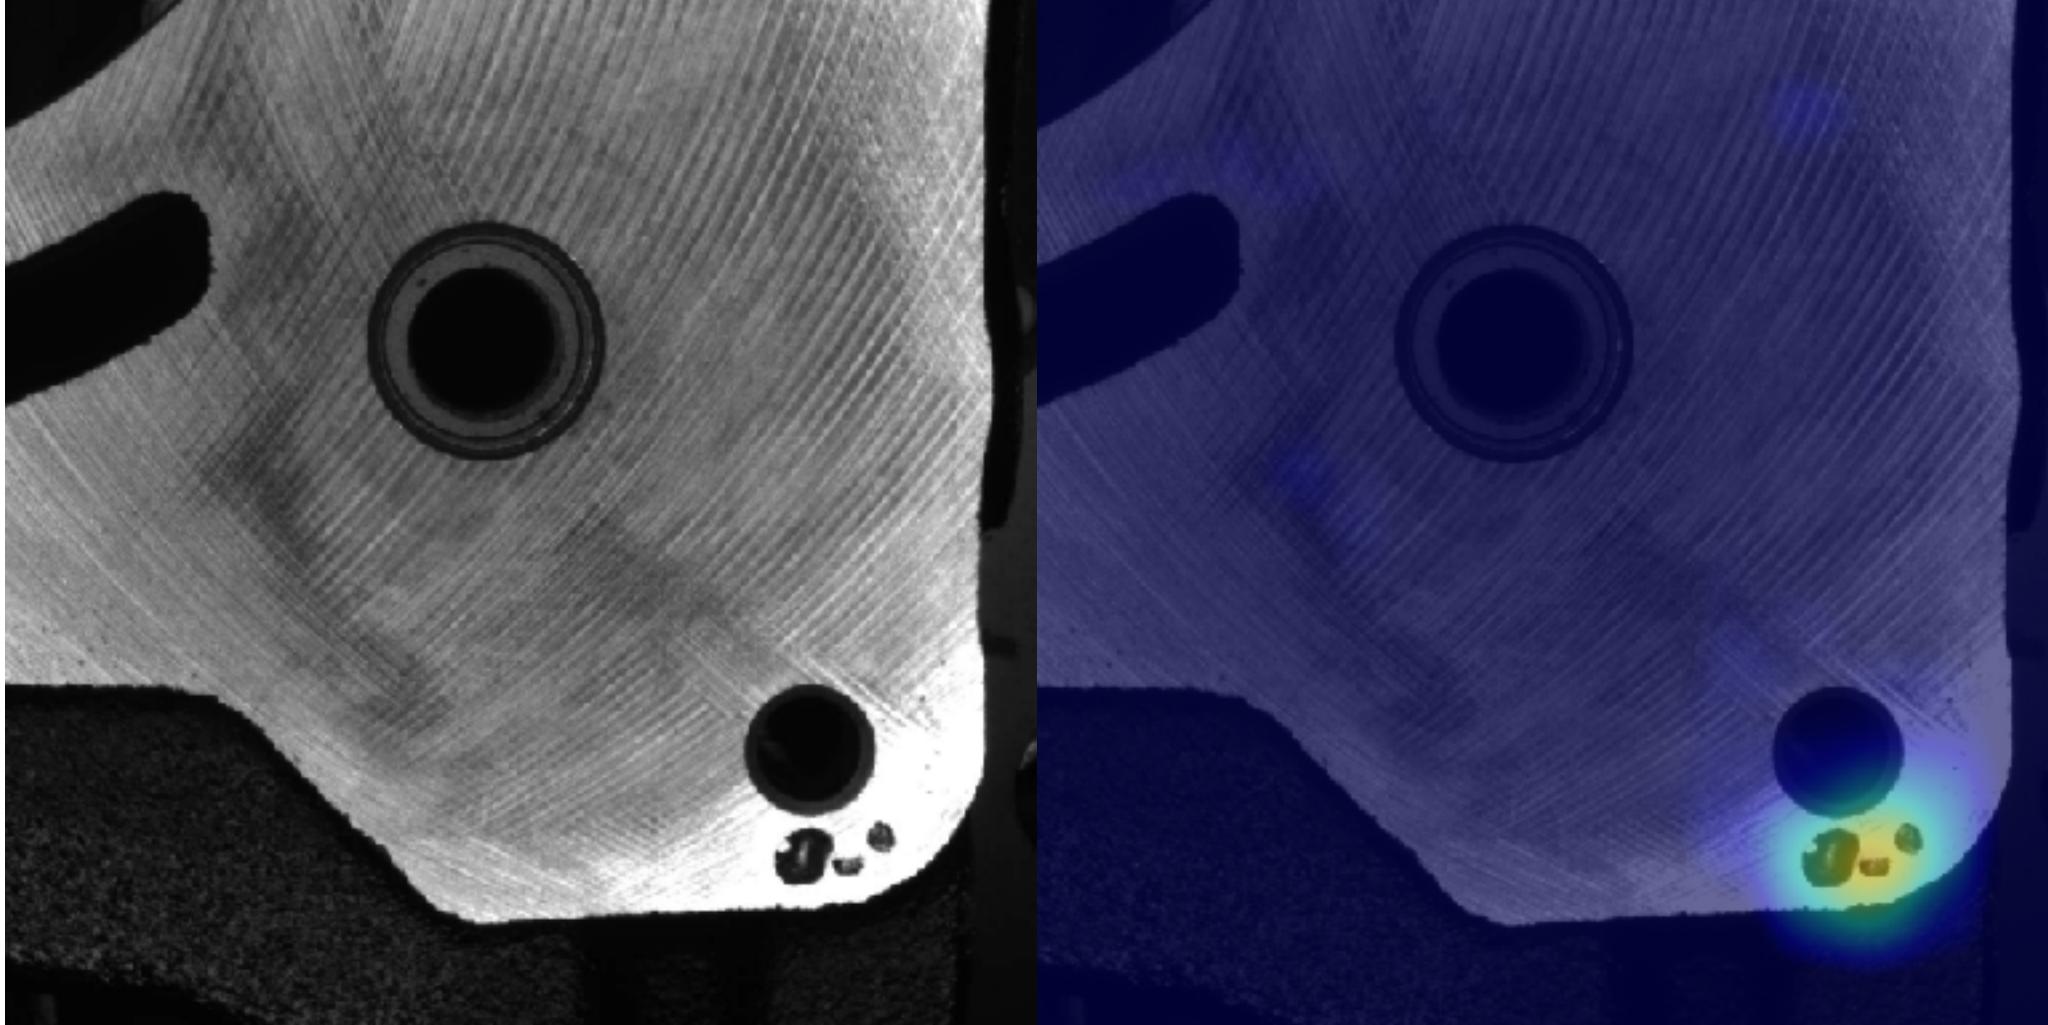

# Use Cases: Internal inspection of raw foundry pieces

# Use Case: Anomaly Detection on engine blocks

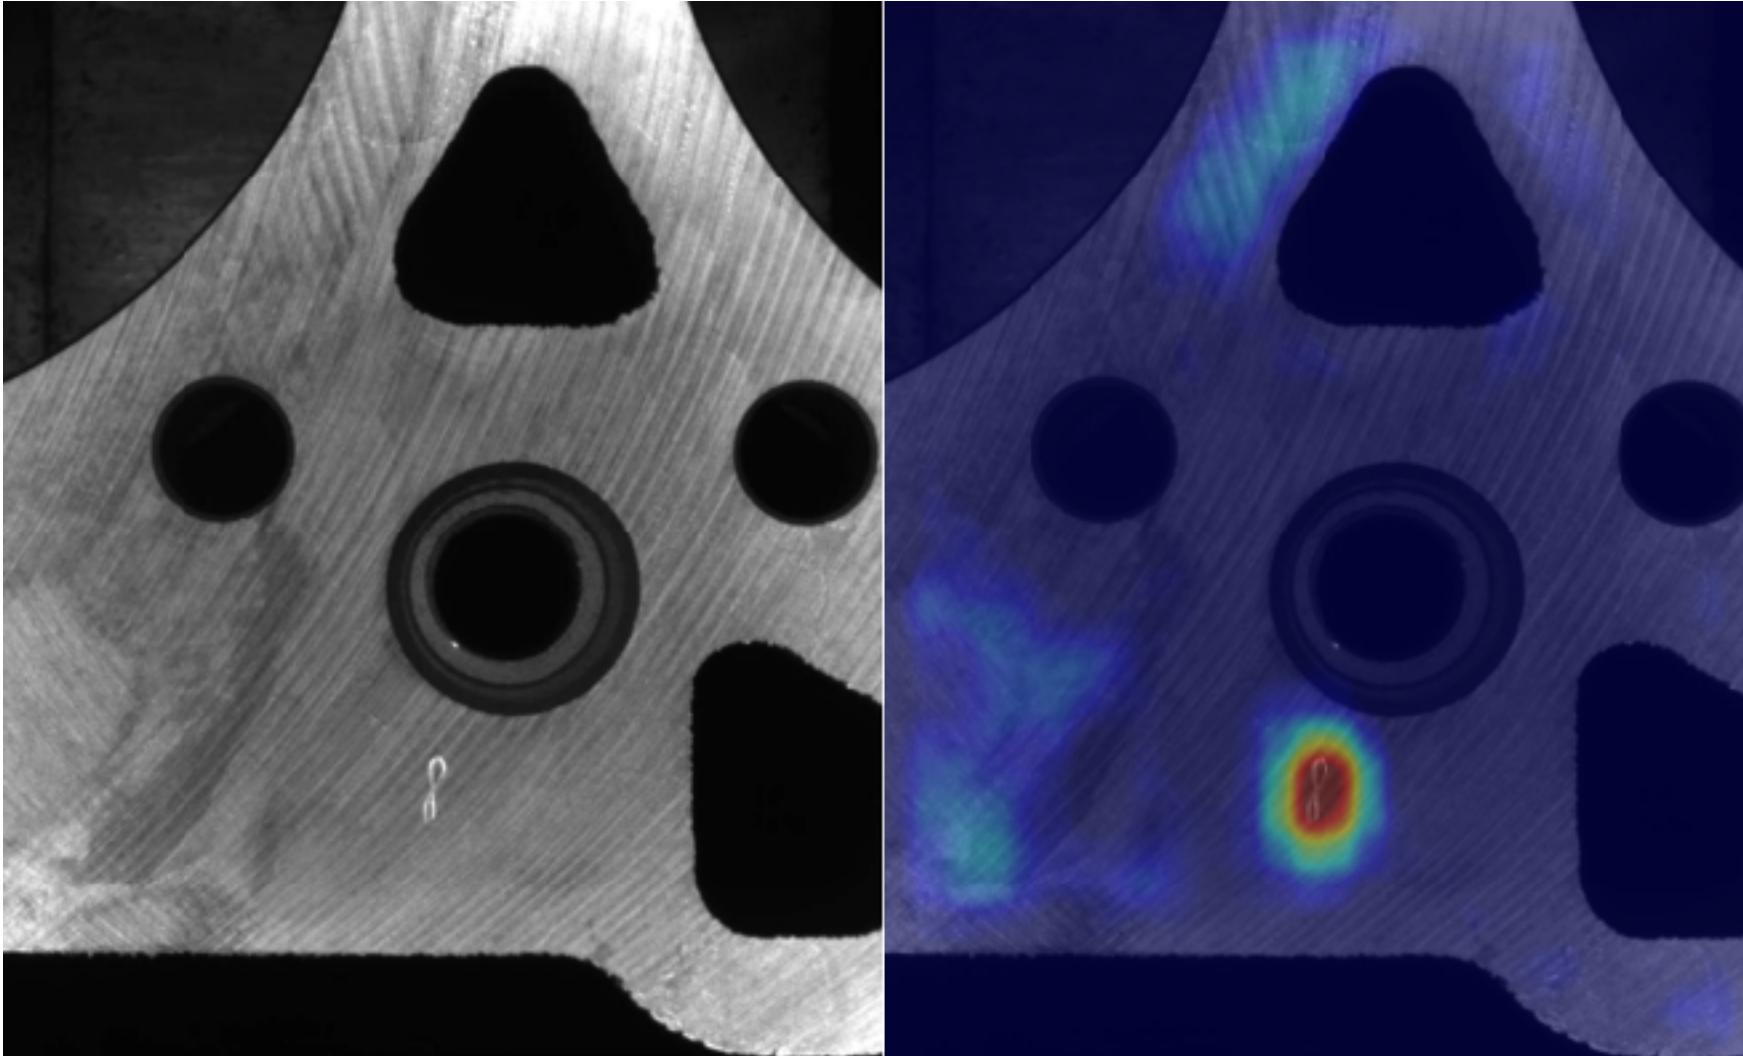

Artificial Intelligence model trained only on GOOD images. It highlights all the anomalies/defects in the image

# Use Case: Anomaly Detection on engine blocks

Artificial Intelligence model trained only on GOOD images. It highlights all the anomalies/defects in the image
